Conductivity Website — §13 CRM, Data and Operational Integration

Checklist · updated 23 October 2026

Done working now **Ready** built; switches on when its setting is added in Vercel **Partly** = website side done, finished in the CRM **Not yet** = team decision

> **How it works:** every form (employer, talent, partner, contact, newsletter, preferences) sends to one entry point, `/api/inquiry`. It checks email and consent, splits the details into CRM records, routes them to the right team, adds duplicate keys and the visit's campaign source, then (1) forwards to the CRM, (2) emails the visitor a confirmation and (3) alerts the team inbox. Data model: `src/lib/crm.ts` · emails: `src/lib/notify.ts`.

13.1 Employer pipeline

Status	Item	Where
DONE	Nine stages defined; new employer leads start at "Inquiry"	`src/lib/crm.ts`
DONE	Organization, industry, country, contact and requirement captured and sent as separate records	Employer form
PARTLY	Commercial value, stage changes, next action and engagement history	Kept up to date in the CRM

13.2 Talent pipeline

Status	Item	Where
DONE	Eight stages and six talent statuses defined; registrants enter as "Registered Interest", never as verified or deployable	`src/lib/crm.ts` · Talent form

13.3 Data architecture *(completed 23 Oct)*

Status	Item	Where
DONE	All 11 records defined; each submission arrives split into them (Organization, Contact, Requirement, Talent Profile, Partnership, Interaction)	`src/lib/crm.ts`
DONE	Talent submissions flagged "restricted"; team alert marks them "do not forward outside Talent Operations"	Every talent lead
DONE	No candidate data shown on the site; server log keeps only routing details	Whole site
PARTLY	Restricted access in the CRM; no sharing with employers without permission and lawful basis	Set as CRM user permissions

13.4 Workflow requirements *(completed 23 Oct)*

Status	Item	Where
DONE	Route to the correct department: Business Development, Talent Operations, Partnerships, Marketing, Data Protection	`/api/inquiry`
READY	Assign lead ownership: one owner per department	Settings `CRM_OWNER_EMPLOYER`, `_TALENT`, `_PARTNER`, `_MARKETING`, `_PRIVACY`
READY	Submission confirmations: email to the visitor (with reference and preferences link) and alert to the team inbox; on-screen reference already works	Settings `RESEND_API_KEY`, `NOTIFY_FROM`, `NOTIFY_EMPLOYER` … or `NOTIFY_DEFAULT`
DONE	Categorize by audience and source page, plus campaign (UTM tags, referrer, landing page)	Every lead

DONE	Duplicates: person key (email) and company key (work email domain; Gmail etc. ignored) on every lead; the CRM merges on these	`src/lib/crm.ts`
DONE	Update communication preferences or unsubscribe	Preferences & Data Requests page (footer and every email)
DONE	Retention and deletion: copy, correct and delete requests routed to Data Protection with a reference; identity confirmed by email first	Same page
PARTLY	Operational and marketing reporting: every lead carries audience, department, owner, source and campaign for reports	Dashboards built in the CRM

To switch everything on: (1) choose the CRM and add `CRM_WEBHOOK_URL`; (2) create a free Resend account and add `RESEND_API_KEY` and the team inbox addresses; (3) add one owner name per department; (4) agree how long candidate data is kept, for the Candidate Data page; (5) set CRM permissions so only authorised staff see talent profiles.
